

Assignment – 17.2

Name: Suhas.s

Ht.no: 2303A51434

bt.no: 21

Task Description – 1(Student Academic Data Cleaning)

- Task:

Use AI assistance to generate a Python script that cleans and prepares a student academic dataset for analysis.

Instructions:

- Handle missing values in marks, attendance, and department.
- Remove duplicate student records based on student ID.
- Standardize text fields such as department names.
- Encode categorical variables like gender and department.

Expected Output:

- A cleaned and encoded Pandas DataFrame suitable for academic performance analysis.

Dataset file :

```
student.csv
1 student_id,name,gender,department,marks,attendance
2 101,Alice,Female,Computer Science,85,90
3 102,Bob,Male,computer science,78,85
4 103,Charlie,Male,Electrical,,88
5 104,David,Male,Mechanical,92,
6 105,Eva,Female,,75,80
```

Code screenshot:

Task Description – 2 (Financial Transaction Data Preprocessing)

• Task:

Preprocess financial transaction data using AI-generated Python code.

Instructions:

- Convert transaction date columns to datetime format.

- Create derived features such as transaction month and year.
- Normalize the transaction amount column.
- Identify and handle extreme transaction values.

Expected Output:

- A transformed dataset with normalized values and newly generated time-based features.

Dataset file:

```
transactions.csv
1 transaction_id,user_id,transaction_date,amount,transaction_type
2 1,1001,2024-01-15,5000,Debit
3 2,1002,2024/02/20,12000,Credit
4 3,1003,15-03-2024,300,Debit
5 4,1004,2024-04-10,999999,Credit
6 5,1005,,4500,Debit
7 |
```

Code

screenshot:

```
process_transactions.py > ...
import pandas as pd

Task 3 – (Environmental Sensor Data Preparation)

- Task:

Clean and preprocess environmental sensor data using AI-assisted scripts.

Instructions:

- Handle missing values in temperature, humidity, and air_quality_index.
- Scale numerical features using standard scaling.
- Encode categorical fields such as sensor_status.
- Split the dataset into training and testing subsets.

Dataset file:

```
sensor_data.csv
1  sensor_id,temperature,humidity,air_quality_index,sensor_status
2  1,30.5,65,120,Active
3  2,28.0,70,,Inactive
4  3,,60,90,Active
5  4,35.2,,150,Faulty
6  5,29.8,75,110,Active
```

Code screenshot:

```
1  # preprocess_sensor_data.py
2  import pandas as pd
3  from sklearn.preprocessing import StandardScaler
4  from sklearn.model_selection import train_test_split
5
6  # Load dataset
7  data = pd.read_csv("sensor_data.csv")
8  print("Original Data:\n", data)
9
10 # -----
11 # 1. Handle Missing Values
12 # -----
13
14 # Fill missing numerical values with mean
15 data['temperature'] = data['temperature'].fillna(data['temperature'].mean())
16 data['humidity'] = data['humidity'].fillna(data['humidity'].mean())
17 data['air_quality_index'] = data['air_quality_index'].fillna(data['air_quality_index'].mean())
18
19 # -----
20 # 2. Encode Categorical Variables
21 # -----
22
23 # Convert sensor_status to numeric (One-hot encoding)
24 data = pd.get_dummies(data, columns=['sensor_status'])
25
26 # -----
27 # 3. Scale Numerical Features
28 # -----
29
30 scaler = StandardScaler()
31
32 numerical_cols = ['temperature', 'humidity', 'air_quality_index']
33 data[numerical_cols] = scaler.fit_transform(data[numerical_cols])
34
35 # -----
36 # 4. Split Dataset
37 # -----
38
39 X = data.drop('sensor_id', axis=1)
40 y = data['sensor_id'] # just for example (usually target variable)
41
42 X_train, X_test, y_train, y_test = train_test_split(
43     X, y, test_size=0.2, random_state=42
44 )
45
46 # -----
47 # Final Output
48 # -----
49
50 print("\nProcessed Data:\n", data)
51 print("\nTraining Set:\n", X_train)
52 print("\nTesting Set:\n", X_test)
53
```

Output:

```

Original Data:
  sensor_id  temperature  humidity  air_quality_index  sensor_status
0         1         30.5        65.0           120.0         Active

Task 4 – (Real-Time Application: Smart City Traffic Data Cleaning)

• Scenario:

A smart city system collects traffic data from multiple sensors, resulting in noisy and inconsistent records.

Requirements:

- Standardize road and location names.
- Fill missing traffic density values using appropriate statistical methods.
- Remove duplicate sensor readings.
- Normalize speed and vehicle count metrics.
- Generate a brief summary comparing dataset quality before and after cleaning

Sample Code:

```

import pandas as pd

traffic = pd.read_csv("traffic_data.csv")

print(traffic.describe())

```

Expected Output:

- A cleaned and normalized traffic dataset with an accompanying data-quality improvement summary.

Dataset file:

```

traffic_data.csv
1  sensor_id,road_name,location,traffic_density,speed,vehicle_count
2  1,MG Road,Hyderabad,80,45,200
3  2,mg road,hyderabad,,50,220
4  3,Ring Road,Delhi,120,60,300
5  4,Ring road,delhi,110,,280
6  5,Highway 1,Mumbai,300,80,500

```

Code screenshot:

```

Task 5 – (Social Media Text Data Cleaning and Feature Extraction)

- Task:

Use AI-assisted Python scripting to clean and preprocess social media text data for sentiment analysis.

Instructions:

- Remove duplicate posts and null text entries.
- Clean text by removing URLs, special characters, and extra spaces.
- Convert text to lowercase and perform basic tokenization.
- Remove stopwords and perform stemming or lemmatization.
- Generate basic text features such as word count and sentimentscore.

Sample Code:

```
import pandas as pd

import re

posts = pd.read_csv("social_media_posts.csv")

print(posts.head())
```

Expected Output:

A cleaned text dataset with extracted features suitable for sentiment analysis models.

Dataset file:

```
social_media_post.csv
1 post_id,text
2 1,I love this product! 🥰 http://example.com
3 2,This is terrible... worst experience ever!!!
4 3,Amazing service and fast delivery :)
5 4,Check this out https://test.com great stuff
6 5,
7 6,I LOVE THIS PRODUCT! 🥰 http://example.com
8 7,Not good, not bad, just okay.
9 8,Absolutely fantastic!!! #happy
10 9,Worst app ever!!! 😡😡
11 10,Good value for money.
```
